

Contents

1	Introduction to Modelling	1
1.1	Some Classical Examples	2
1.1.1	Malthus model	2
1.1.2	Logistic models	6
1.1.3	Phillips model	10
1.1.4	Accelerator model	12
1.1.5	Evolution of supply	12
1.1.6	Leslie model	14
1.1.7	Lotka-Volterra predator-prey model	14
1.1.8	Time-delay logistic equation	16
1.2	Continuous Time and Discrete Time Models	17
1.2.1	Differential and difference equations	18
1.2.2	Systems of differential and difference equations	21
2	First Order Differential Equations	25
2.1	Introduction	25
2.2	Some Solvable Equations	26
2.2.1	Differential equations with separable variables	26
2.2.2	Solow-Swan model	29
2.2.3	Logistic model	31
2.2.4	Linear equations	32
2.2.5	Market dynamics	37
2.2.6	Other types of equations	38
2.3	The Cauchy Problem	44
2.3.1	Existence and uniqueness	44
2.3.2	Maximal interval of existence	48
2.4	Autonomous Equations	52
2.4.1	Steady states, stability, phase space	52
2.4.2	Stability by linearization	56
2.5	A Neoclassical Growth Model	57
2.6	Exercises	61
3	First Order Difference Equations	65
3.1	Introduction	65
3.2	Linear Equations	65
3.2.1	Linear homogeneous equations	65
3.2.2	Nonhomogeneous linear equations	66
3.2.3	Simple and compounded capitalization	69

3.2.4 Cobweb model	69
3.3 Nonlinear Autonomous Equations	72
3.3.1 Orbits, stairstep diagram, steady states (fixed or equilibrium points)	72
3.3.2 Steady states and stability	74
3.3.3 Stability of periodic orbits	78
3.3.4 Chaotic behavior	82
3.3.5 Discrete logistic equation	83
3.4 Exercises	87
4 Linear Differential Equations with Constant Coefficients	91
4.1 Second Order Equations	91
4.1.1 Homogeneous equations	91
4.1.2 Nonhomogeneous equations	95
4.2 Higher Order Equations	97
4.2.1 Homogeneous equations	97
4.2.2 Nonhomogeneous equations	98
4.2.3 Stability	101
4.2.4 Phillips model	102
4.3 Exercises	105
5 Linear Difference Equations with Constant Coefficients	107
5.1 Second Order Equations	107
5.1.1 Homogeneous equations	107
5.1.2 Fibonacci sequence	110
5.1.3 Nonhomogeneous equations	112
5.2 Higher Order Equations	113
5.2.1 Homogeneous equations	113
5.2.2 Nonhomogeneous equations	114
5.2.3 Stability	116
5.2.4 Accelerator model	117
5.3 Exercises	118
6 Systems of Differential Equations	119
6.1 The Cauchy Problem	119
6.2 Linear Systems	121
6.2.1 Global existence and uniqueness	121
6.2.2 Homogeneous systems	121
6.2.3 Nonhomogeneous systems	123
6.2.4 Equations of order n	125
6.3 Bidimensional Systems with Constant Coefficients	126
6.3.1 General integral	126
6.3.2 Stability of the zero solution	130
6.4 Systems with Constant Coefficients (higher dimension)	130
6.4.1 Exponential matrix	130

6.4.2	Cauchy problem and general integral	136
6.4.3	Nonhomogeneous systems	138
6.4.4	Stability of the zero solution	139
6.5	Exercises	140
7	Bidimensional Autonomous Systems	143
7.1	Phase Plane Analysis	143
7.1.1	Orbits	143
7.1.2	Steady states, cycles and their stability	147
7.1.3	Phase portrait	149
7.2	Linear Systems. Classification of steady states	154
7.3	Non-linear Systems	164
7.3.1	The linearization method	164
7.3.2	Outline of the Liapunov method	167
7.4	Some Models	170
7.4.1	Lotka-Volterra model	170
7.4.2	A competitive equilibrium model	176
7.5	Higher Dimensional Systems	180
7.6	Exercises	181
8	Systems of Difference Equations	183
8.1	Linear Systems with Constant Coefficients	183
8.1.1	Homogeneous systems	184
8.1.2	Bidimensional homogeneous systems	185
8.1.3	Nonhomogeneous systems	189
8.2	Stability	189
8.2.1	Election polls	191
8.2.2	A model of students partition	193
8.2.3	Leslie model	194
8.3	Autonomous systems	194
8.3.1	Discrete Lotka-Volterra model	196
8.3.2	Logistic equation with delay	197
8.4	Exercises	199
9	The Calculus of Variations	203
9.1	Introduction	203
9.2	The Simplest Problem	206
9.2.1	Fixed boundaries. Euler equation	206
9.2.2	Special cases of the Euler-Lagrange equation	212
9.2.3	Free end values. Transversality conditions	216
9.3	A Sufficient Condition of Optimality	219
9.4	Infinite Horizon. Unbounded Interval. An Optimal Growth Problem	220
9.5	The General Variation of a Functional	224
9.6	Isoperimetric Problems	229
9.7	Exercises	234

10 Optimal Control Problems. Variational Methods	239
10.1 Introduction	239
10.1.1 Structure of a control problem. One-dimensional state and control	239
10.1.2 Main questions and techniques	242
10.2 Continuous Time Systems	243
10.2.1 Free final state. Necessary conditions	243
10.2.2 Sufficient conditions	247
10.2.3 Interpretation of the multiplier	249
10.2.4 Maximum principle. Bounded controls	250
10.2.5 Discounting. Current values	251
10.2.6 Applications. Infinite horizon. Comparative analysis	252
10.2.7 Terminal payoff and various endpoints conditions	257
10.2.8 Discontinuous and bang-bang control. Singular solutions	264
10.2.9 An advertising model control	266
10.3 Discrete Time Problems	270
10.3.1 The simplest problem	270
10.3.2 A discrete model for optimal growth	273
10.3.3 State and control constraints	274
10.3.4 Interpretation of the multiplier	280
10.4 Exercises	282
11 Dynamic Programming	287
11.1 Introduction	287
11.2 Continuous Time System. The Bellman Equation	290
11.3 Infinite Horizon. Discounting	295
11.4 Discrete Time Systems	297
11.4.1 The value function. The Bellman equation	297
11.4.2 Optimal resource allocation	301
11.4.3 Infinite horizon. Autonomous problems	303
11.4.4 Renewable resource management	304
A Appendix	307
A.1 Eigenvalues and Eigenvectors	307
A.2 Functional Spaces	310
A.3 Static Optimization	312
A.3.1 Free optimization	312
A.3.2 Constrained optimization. Equality constraints	313
A.3.3 Constrained optimization. Inequality constraints	315
